PROBLEM STATEMENT #53 | Media, Events & Community Freelance Content Creator Escrow Platform

NAME: ANANYA BELIMALLUR RAJASHEKAR
SRN: PES2UG24CS057

SCREENSHOTS:

Jira backlog with Epics and User Stories and story point assignments

Sprint board (Active Sprint view)

Burndown Chart:

REFLECTION QUESTIONS:

1. Did your estimations reflect the actual effort?

Since this was a simulated sprint rather than real development work, the story points (Fibonacci-based estimates of complexity) weren't tested against real effort. In a live sprint, we'd expect this line to jag as work actually completes; here it dropped almost instantly, showing that simulation compresses time, a live team would see decreases spread across days as work items move from To Do to Done.

2. Was your backlog well-prioritized?

Yes. High priority items (draft submission, watermarking, approval, payment release, encryption) were placed in Sprint 1 and the start of Sprint 2, ensuring the core escrow workflow (submit → review → approve → pay) was completed first. Medium priority items (revision requests, performance benchmarking) were scheduled later since they support rather than block the core value flow.

3. How did your simulated sprint align with your plan?

Both sprints completed all planned stories (26 points in Sprint 1, 24 in Sprint 2), matching the planned scope with no scope creep or carried-over items, indicating good sprint planning and appropriately-sized commitments.

4. What insights did the burndown chart give about your team's capacity?

The chart shows work completing well ahead of the sprint's guideline pace. In a real team this could mean the sprint was under-committed and could handle more story points, or that estimates were slightly inflated relative to actual complexity, a signal to increase capacity or tighten estimates in future sprints.
